

PestLLM

A Simple Guide

PestLLM — A Simple Guide

A plain-language explanation of what this system is and what it does — no technical background needed. If you run the business or work in it, this is the one to read.

In one sentence

PestLLM is a smart assistant that lives on your company's WhatsApp number. It chats with customers day and night — answering questions, giving prices, booking appointments, and knowing when to hand things to a real person — so your team doesn't have to reply to every message by hand.

The assistant introduces itself to customers as "**Ajax**".

What the customer sees

A customer sends a WhatsApp message to your business number, just like texting a friend. Ajax replies in seconds, any time of day. In a normal conversation it can:

- **Answer questions** about your services in a friendly, natural way.
- **Give a price** — always from your real price list, never a made-up number.
- **Identify a pest from a photo** — the customer snaps a picture of the bug, and

Ajax tells them what it likely is and what service they need.

- **Book an appointment** — it checks what times are free, offers a slot, and

confirms the booking with a short code (like a ticket number).

- **Reschedule or cancel** — using that same code.
- **Handle yearly plans** — if a customer wants an annual maintenance contract or

wants to renew one, Ajax takes the request and passes it to your team.

- **Know its limits** — if someone was bitten or stung, has a complaint, or needs something unusual, Ajax immediately alerts a real person instead of guessing.

The whole thing feels like chatting with a helpful, well-trained employee who never sleeps and never forgets your prices.

What your office team sees

Managers and owners log in to a **web dashboard** from any computer or phone — no app to install. From there they can:

Section	What it's for
Appointments	All upcoming jobs, laid out by day.
Dispatch	A live map showing where each technician is right now.
Conversations	The full chat history with any customer.
Escalations	The list of chats Ajax flagged for a human to handle.
Pricing	Your price list — change a price and Ajax uses the new one instantly.
Contracts (AMC)	All your annual maintenance plans and their renewal dates.
Reports	Revenue, job counts, and how each technician is doing.
Team	Add or remove staff and set who can see what.

Everything updates live. If one manager assigns a job, everyone else sees it change on their screen straight away.

What your technicians see

Technicians get a **mobile app** on their phone (it installs from the web — no app store needed). It shows only their own jobs. On it they can:

- See today's jobs with the customer's name, address, and phone number.
- Tap the address to open Google Maps, or tap the number to call.
- Press "**Start travel**" — this shares their live location so the customer gets a

tracking link, just like a food-delivery app.

- Add notes and upload before/after photos from the job.
 - Mark a job as finished.
 - Flag a problem for the office.
-

Messages that go out on their own

Ajax also sends helpful messages automatically, so nobody has to remember to:

- **Remind** customers the day before their appointment.
- **Nudge** a customer who started chatting but went quiet.
- **Alert** a customer when the technician is on the way (with the tracking link).
- **Remind** customers when their yearly plan is about to expire.

If a customer ever replies **STOP**, Ajax immediately stops the marketing-style messages — but still sends the important ones like booking confirmations and "technician on the way" alerts, because those are part of the

service they booked.

Privacy and peace of mind

- Old chat history is **deleted automatically after six months**.
- Customers can opt out of promotional messages any time by replying STOP.
- The system follows India's data-protection rules and has a privacy notice

customers can read.

Why it helps the business

- **Replies instantly, 24/7** — no missed messages, no waiting until morning.
- **Never quotes the wrong price** — it only uses the price list you control.
- **Books jobs while you sleep** — appointments land in the dashboard automatically.
- **Frees up your staff** — they handle the tricky cases; Ajax handles the routine ones.
- **Keeps customers informed** — reminders and live tracking mean fewer no-shows

and fewer "where's the technician?" calls.

What it doesn't do (just so it's clear)

- It doesn't take payments or deposits — your team handles money directly.
 - It doesn't understand voice notes yet — customers should type or send photos.
 - It won't pretend to handle an emergency — anything urgent goes straight to a human.
-

In short: Ajax is a tireless front-desk assistant on WhatsApp, backed by a dashboard for your office and an app for your field team.
